Imagine you're a tiny creature with a big, scary name like 'earwig'! These little fellows, often no more than an inch long, have a dark brown or black body that is long and slender. They have six legs and a pair of forceps-like pincers on their abdomen, which they use for defense and hunting. Despite their scary name, earwigs are quite harmless and their pincers aren't strong enough to harm a human.

Keeping their pincers busy, earwigs have a varied diet. They

munch on a wide range of stuff, from plant debris and ripe fruits to other insects and their eggs. Because of their eating habits, they can be both helpful and harmful to gardeners. They aid in breaking down organic matter, but can also damage crops and ornamental plants.

From munching on plants and insects, let's jump to where these creatures call home. Earwigs are found almost everywhere around the world, but they prefer damp, cool places. They often hide in small, tight crevices during the day and come out at night to feed. You might find them under pots, in mulch, or amidst leaf piles in your garden.

Now that we've visited their home, let's take a peek into their life cycle. Earwigs undergo incomplete metamorphosis, which means they pass through three stages: egg, nymph, and adult. Interestingly, they are one of the few non-social insect species that show maternal care. Mama earwigs guard their eggs and young until they are ready to fend for themselves, which is quite unique in the insect world!

Earwigs

Name:

Solv	e each problem.		
	the article to answer the question.What color might the body of an earwig be?A. greenC. yellow		black red
2)	How big are earwigs? A. no more than an inch long C. half a foot in size		tiny, like a grain of sand several feet long
3)	Are earwigs deadly to humans?A. Only male earwigsC. Yes		No Sometimes
4)	What is part of the diet of an earwig?A. small rodentsC. lumber wood		walnuts plant debris
5)	How is the maternal care of earwigs?A. Mama earwigs build nests out of twigs for their youngC. Mama earwigs eat their young		Mama earwigs guard their eggs and young Mama earwigs leave their eggs alone
6)	What are the pincers of an earwig used for?A. building nestsC. pollination	B.	defense and hunting communication
7)	Where do earwigs prefer to live?A. freezing placesC. hot deserts		damp places grassy plains
8)	When do earwigs come out to feed?A. In the morningC. At night		All the time In the afternoon
9)	What is unique about the way earwigs care forA. The young earwigs take care of themselves.C. Earwigs don't have young.	В.	Earwigs leave their young after they hatch. Mama earwigs guard their eggs and
10)	What is the life cycle of an earwig called?A. Adaptable metamorphosisC. Flexible metamorphosis		young. Complete metamorphosis Incomplete metamorphosis

Determine if the statements is something the animal would say (W) or it it is not something the animal would say (N).
